

Making Visible and Keeping Concealed: Architectures of Melen Water Supply Project

Elif Bek

Abstract

This research asks what kinds of architecture a territorial water infrastructure produces. It examines this question through the Melen Water Supply Project, a system that supplies drinking water to Istanbul and that operates while the reservoir giving the project its name has not yet been impounded. Only a small part of the interventions carried out in the basin is accessible as information. This research therefore focuses on the question of visibility: how does architecture make an otherwise largely invisible water infrastructure visible, legible, and publicly imaginable, and, conversely, how does it conceal, obscure, or restrict access to it?

The architectural structures and spaces that constitute the Melen system will be examined with consideration of visibility not simply as a visual condition but in relation to legibility, knowledge, access, representation, and publicness. These structures that define the relationship with water also define how interaction with water gave shape to the built environment across supply, sanitation, and flood mitigation alike (Murphy, 2024).

Each register within the Melen Water Supply Project can be approached through a different set of elements that contain the issue of visibility. Legibility can be read in the structures that are passed without being recognised for what they are, the intake regulator and the pumping station among them. It can also be read in the treatment plants, which are recognisable as a building type but not as part of a project that supplies another city. Knowledge can be traced in what is documented and released, since much of the architecture appears publicly only through a protection plan and its annexed map, including the interception collectors that run buried alongside the watercourses and the dispersed network of wastewater facilities. Access can be observed in the fence, the gate, the service road, and the distance the regulations prescribe between recreational use and the water intake. Representation can be located in the drawing, the photograph, and the caption through which this dual system of supply and sanitation can be defined in its entirety. Publicness, understood here as visibility in relation to public use, can be discussed in elements such as the filtration strips, bands of land along the watercourses that the administration expropriates for İSKİ, grades, and plants so that vegetation filters surface runoff before it reaches the water.

The questions of how architecture mediates between the technical infrastructure of water and what becomes visible, to whom, and through what architectural forms and spatial arrangements will be posed. The Melen Water Supply Project comprises structures that are approached and used, as well as structures that are passed without notice at the "infra" as the spaces of water that become visible and invisible intermittently within the basin. By setting the visible and the invisible of the project's architecture, and the relationalities between them will illustrate the stance on the interaction of water within the city.

Literature Review

The literature review conducted within this research was built on core readings that address the visibility of infrastructure and on the question of whether the research is positioned within visual culture or critical geography, taking visibility in relation to legibility, knowledge, access, representation, and publicness as its framework. The TU Delft Repository, DSpace@MIT and

MIT Primo, HOLLIS, JSTOR, Google Scholar, Crossref, OpenMETU and Academia.edu were searched with a focus on architecture-focused sources in both fields and on sources that address the question of visibility, and each reference was verified through Crossref, publisher pages, repository records, or the full text.

Of the thirty sources included in this review, twenty-one address the question of visibility. The remaining nine comprise four architecture-focused sources in visual culture, one architecture-focused source in critical geography, one other source with a strong architectural approach, two sources with a weak architectural approach and one master's thesis.

Sources addressing the question of visibility (21 sources)

Literature Review Summary

This research asks what kinds of architecture a territorial water infrastructure produces, taking the Melen Water Supply Project as its primary case, and focuses on the question of visibility. The literature review considers visibility not simply as a visual condition but in relation to legibility, knowledge, access, representation, and publicness, and it takes as its framework the question of whether this research belongs within visual culture or critical geography. The review draws on the TU Delft Repository, DSpace@MIT and MIT Primo, HOLLIS, JSTOR, Google Scholar, Crossref, OpenMETU, and Academia.edu, and it verifies each reference through Crossref, publisher pages, repository records, or the full text.

Twenty-one of the thirty sources address the question of visibility directly. In terms of approach, nine sources belong to visual culture and eight to critical geography, while thirteen fall within neither field. The tables of the review gather the twenty-one sources on visibility in a single group, so the headings for the two fields list only the sources that remain outside it. The review also distinguishes sources that place building, space, landscape, or design at the centre of their analysis from those that approach infrastructure through anthropology, science and technology studies, geography, philosophy, or management without an architectural analysis.

The conceptual axis of the review lies in the tension between Star and Larkin. Star and Ruhleder (1996) list "becomes visible upon breakdown" among the dimensions of infrastructure (p. 113), and Larkin (2013, p. 336) identifies Star (1999) as the source of the assertion that infrastructures are "by definition invisible". Larkin questions this assertion and argues that invisibility "is only one and at the extreme edge of a range of visibilities that move from unseen to grand spectacles and everything in between" (p. 336). This research can define the question of visibility in relation to this range. Easterling (2014) takes a comparable position: she notes that infrastructure "is considered to be a hidden substrate" and argues that it is now "the overt point of contact and access between us all" (p. 11).

Foucault (1977) and Deleuze (1988) provide the theoretical vocabulary that links architecture, visibility, and power, Deleuze through the distinction between "the visible and the articulable" (p. 32). Kaika and Swyngedouw (2000) and Kaika (2006) offer the architectural argument closest to the question of this research. Kaika and Swyngedouw read dams, purification plants, and pumping stations as icons that early modernity designed, ornamented, and placed prominently in the city, and they trace how these structures "began to disappear from the cityscape" in high modernity (Abstract). Gandy (2014) situates water at "the intersection of landscape and infrastructure, crossing between visible and invisible domains of urban space" (p. 1), and Ghosn and Jazairy (2018) describe architectural drawing as a device that "makes visible absent things" (p. 22). Mattern (2013) discusses practices that address what seems "illegible or even unmappable" (Touring, Collecting, Documenting Infrastructure section, para. 3), and she cautions that "the ambitious intentions to 'make visible the invisible'" can "too often become ends in themselves" (From Perception to Awareness ... and Action section, para. 2). Colven (2020) and Kambic (2015) inform the registers of publicness, legibility, and access, while Kılıç (2020) and Sarıkaya Işık (2019) offer comparable material on the water infrastructure and water structures of Istanbul.

The visual culture sources concentrate on representation, whereas the critical geography sources address visibility together with access, knowledge, and publicness, and they do so for water. The registers of knowledge, access, and publicness, which this research locates in the protection plan, in the fence and the service road, and in the filtration strips, find their closest counterparts in the critical geography sources, and both groups share the register of representation. On this basis, critical geography can cover a wider range of the registers of visibility for territorial water infrastructure, while the visual culture sources remain the reference for representation and for the theoretical vocabulary of visibility. The sources point towards the following formulation: "This research is situated at the intersection of architectural theory, infrastructure studies, and critical geography, examining how architecture mediates the visibility, legibility, and public intelligibility of territorial water infrastructure."

Full texts or verified pages with page numbers support the reading of eight sources. For the others, including most of the critical geography sources, the reading rests on abstracts, publisher descriptions, or titles, and it remains open to revision once this research reads their full texts. For Hutton (2019), da Cunha (2019), and Graham and Marvin (2001), this research has not yet reached the authors' own text with page numbers, and the review therefore paraphrases them without quotation. This research has not yet read Varnelis (2008) and the two works by Mathur and da Cunha (2001, 2016) for the question of visibility. Murphy (2024) is a course description of the MIT Department of Architecture rather than a publication. The placement of each source within visual culture or critical geography is a reading that rests on verified statements, not a position the sources themselves declare.
